

COPYRIGHT TRANSFER AGREEMENT

Date: _____ Contributor name: _____

Contributor address: _____

Manuscript number (Editorial office only): _____

Re: Manuscript entitled _____

_____ (the "Contribution")

for publication in _____ (the "Journal")

published by _____ ("Wiley-Blackwell").

Dear Contributor(s):

Thank you for submitting your Contribution for publication. In order to expedite the editing and publishing process and enable Wiley-Blackwell to disseminate your Contribution to the fullest extent, we need to have this Copyright Transfer Agreement signed and returned as directed in the Journal's instructions for authors as soon as possible. If the Contribution is not accepted for publication, or if the Contribution is subsequently rejected, this Agreement shall be null and void. **Publication cannot proceed without a signed copy of this Agreement.**

A. COPYRIGHT

1. The Contributor assigns to Wiley-Blackwell, during the full term of copyright and any extensions or renewals, all copyright in and to the Contribution, and all rights therein, including but not limited to the right to publish, republish, transmit, sell, distribute and otherwise use the Contribution in whole or in part in electronic and print editions of the Journal and in derivative works throughout the world, in all languages and in all media of expression now known or later developed, and to license or permit others to do so.

2. Reproduction, posting, transmission or other distribution or use of the final Contribution in whole or in part in any medium by the Contributor as permitted by this Agreement requires a citation to the Journal and an appropriate credit to Wiley-Blackwell as Publisher, and/or the Society if applicable, suitable in form and content as follows: (Title of Article, Author, Journal Title and Volume/Issue, Copyright © [year], copyright owner as specified in the Journal). Links to the final article on Wiley-Blackwell's website are encouraged where appropriate.

B. RETAINED RIGHTS

Notwithstanding the above, the Contributor or, if applicable, the Contributor's Employer, retains all proprietary rights other than copyright, such as patent rights, in any process, procedure or article of manufacture described in the Contribution.

C. PERMITTED USES BY CONTRIBUTOR

1. **Submitted Version.** Wiley-Blackwell licenses back the following rights to the Contributor in the version of the Contribution as originally submitted for publication:

a. After publication of the final article, the right to self-archive on the Contributor's personal website or in the Contributor's institution's/employer's institutional repository or archive. This right extends to both intranets and the Internet. The Contributor may not update the submission version or replace it with the published Contribution. The version posted must contain a legend as follows: This is the pre-peer reviewed version of the following article: FULL CITE, which has been published in final form at [Link to final article].

b. The right to transmit, print and share copies with colleagues.

2. **Accepted Version.** Re-use of the accepted and peer-reviewed (but not final) version of the Contribution shall be by separate agreement with Wiley-Blackwell. Wiley-Blackwell has agreements with certain funding agencies governing reuse of this version. The details of those relationships, and other offerings allowing open web use, are set forth at the following website: <http://www.wiley.com/go/funderstatement>. NIH grantees should check the box at the bottom of this document.

3. **Final Published Version.** Wiley-Blackwell hereby licenses back to the Contributor the following rights with respect to the final published version of the Contribution:

a. Copies for colleagues. The personal right of the Contributor only to send or transmit individual copies of the final published version in any format to colleagues upon their specific request provided no fee is charged, and further-provided that there is no systematic distribution of the Contribution, e.g. posting on a listserve, website or automated delivery.

b. Re-use in other publications. The right to re-use the final Contribution or parts thereof for any publication authored or edited by the Contributor (excluding journal articles) where such re-used material constitutes less than half of the total material in such publication. In such case, any modifications should be accurately noted.

c. Teaching duties. The right to include the Contribution in teaching or training duties at the Contributor's institution/place of employment including in course packs, e-reserves, presentation at professional conferences, in-house training, or distance learning. The Contribution may not be used in seminars outside of normal teaching obligations (e.g. commercial seminars). Electronic posting of the final published version in connection with teaching/training at the Contributor's institution/place of employment is permitted subject to the implementation of reasonable access control mechanisms, such as user name and password. Posting the final published version on the open Internet is not permitted.

d. Oral presentations. The right to make oral presentations based on the Contribution.

4. **Article Abstracts, Figures, Tables, Data Sets, Artwork and Selected Text (up to 250 words).**

a. Contributors may re-use unmodified abstracts for any non-commercial purpose. For on-line uses of the abstracts, Wiley-Blackwell encourages but does not require linking back to the final published versions.

b. Contributors may re-use figures, tables, data sets, artwork, and selected text up to 250 words from their Contributions, provided the following conditions are met:

- (i) Full and accurate credit must be given to the Contribution.
- (ii) Modifications to the figures, tables and data must be noted. Otherwise, no changes may be made.
- (iii) The reuse may not be made for direct commercial purposes, or for financial consideration to the Contributor.
- (iv) Nothing herein shall permit dual publication in violation of journal ethical practices.

D. CONTRIBUTIONS OWNED BY EMPLOYER

1. If the Contribution was written by the Contributor in the course of the Contributor's employment (as a "work-made-for-hire" in the course of employment), the Contribution is owned by the company/employer which must sign this Agreement (in addition to the Contributor's signature) in the space provided below. In such case, the company/employer hereby assigns to Wiley-Blackwell, during the full term of copyright, all copyright in and to the Contribution for the full term of copyright throughout the world as specified in paragraph A above.

2. In addition to the rights specified as retained in paragraph B above and the rights granted back to the Contributor pursuant to paragraph C above, Wiley-Blackwell hereby grants back, without charge, to such company/employer, its subsidiaries and divisions, the right to make copies of and distribute the final published Contribution internally in print format or electronically on the Company's internal network. Copies so used may not be resold or distributed externally. However the company/employer may include information and text from the Contribution as part of an information package included with software or other products offered for sale or license or included in patent applications. Posting of the final published Contribution by the institution on a public access website may only be done with Wiley-Blackwell's written permission, and payment of any applicable fee(s). Also, upon payment of Wiley-Blackwell's reprint fee, the institution may distribute print copies of the published Contribution externally.

E. GOVERNMENT CONTRACTS

In the case of a Contribution prepared under U.S. Government contract or grant, the U.S. Government may reproduce, without charge, all or portions of the Contribution and may authorize others to do so, for official U.S. Govern-

ment purposes only, if the U.S. Government contract or grant so requires. (U.S. Government, U.K. Government, and other government employees: see notes at end)

F. COPYRIGHT NOTICE

The Contributor and the company/employer agree that any and all copies of the final published version of the Contribution or any part thereof distributed or posted by them in print or electronic format as permitted herein will include the notice of copyright as stipulated in the Journal and a full citation to the Journal as published by Wiley-Blackwell.

G. CONTRIBUTOR'S REPRESENTATIONS

The Contributor represents that the Contribution is the Contributor's original work, all individuals identified as Contributors actually contributed to the Contribution, and all individuals who contributed are included. If the Contribution was prepared jointly, the Contributor agrees to inform the co-Contributors of the terms of this Agreement and to obtain their signature to this Agreement or their written permission to sign on their behalf. The Contribution is submitted only to this Journal and has not been published before. (If excerpts from copyrighted works owned by third parties are included, the Contributor will obtain written permission from the copyright owners for all uses as set forth in Wiley-Blackwell's permissions form or in the Journal's Instructions for Contributors, and show credit to the sources in the Contribution.) The Contributor also warrants that the Contribution contains no libelous or unlawful statements, does not infringe upon the rights (including without limitation the copyright, patent or trademark rights) or the privacy of others, or contain material or instructions that might cause harm or injury.

U.S. Government work

Note to U.S. Government Employees

A contribution prepared by a U.S. federal government employee as part of the employee's official duties, or which is an official U.S. Government publication, is called a "U.S. Government work," and is in the public domain in the United States. In such case, the employee may cross out Paragraph A.1 but must sign (in the Contributor's signature line) and return this Agreement. If the Contribution was not prepared as part of the employee's duties or is not an official U.S. Government publication, it is not a U.S. Government work.

U.K. Government work
(Crown Copyright)

Note to U.K. Government Employees

The rights in a Contribution prepared by an employee of a U.K. government department, agency or other Crown body as part of his/her official duties, or which is an official government publication, belong to the Crown. U.K. government authors should submit a signed declaration form together with this Agreement. The form can be obtained via <http://www.opsi.gov.uk/advice/crown-copyright/copyright-guidance/publication-of-articles-written-by-ministers-and-civil-servants.htm>

Other Government work

Note to Non-U.S., Non-U.K. Government Employees

If your status as a government employee legally prevents you from signing this Agreement, please contact the editorial office.

NIH Grantees

Note to NIH Grantees

Pursuant to NIH mandate, Wiley-Blackwell will post the accepted version of Contributions authored by NIH grant-holders to PubMed Central upon acceptance. This accepted version will be made publicly available 12 months after publication. For further information, see www.wiley.com/go/nihmandate.

Softproofing for advanced Adobe Acrobat Users - NOTES tool

NOTE: AROBAT READER FROM THE INTERNET DOES NOT CONTAIN THE NOTES TOOL USED IN THIS PROCEDURE.

Acrobat annotation tools can be very useful for indicating changes to the PDF proof of your article. By using Acrobat annotation tools, a full digital pathway can be maintained for your page proofs.

The NOTES annotation tool can be used with either Adobe Acrobat 3.0x or Adobe Acrobat 4.0. Other annotation tools are also available in Acrobat 4.0, but this instruction sheet will concentrate on how to use the NOTES tool. Acrobat Reader, the free Internet download software from Adobe, DOES NOT contain the NOTES tool. In order to softproof using the NOTES tool you must have the full software suite Adobe Acrobat Exchange 3.0x or Adobe Acrobat 4.0 installed on your computer.

Steps for Softproofing using Adobe Acrobat NOTES tool:

1. Open the PDF page proof of your article using either Adobe Acrobat Exchange 3.0x or Adobe Acrobat 4.0. Proof your article on-screen or print a copy for markup of changes.
2. Go to File/Preferences/Annotations (in Acrobat 4.0) or File/Preferences/Notes (in Acrobat 3.0) and enter your name into the "default user" or "author" field. Also, set the font size at 9 or 10 point.
3. When you have decided on the corrections to your article, select the NOTES tool from the Acrobat toolbox and click in the margin next to the text to be changed.
4. Enter your corrections into the NOTES text box window. Be sure to clearly indicate where the correction is to be placed and what text it will effect. If necessary to avoid confusion, you can use your TEXT SELECTION tool to copy the text to be corrected and paste it into the NOTES text box window. At this point, you can type the corrections directly into the NOTES text box window. **DO NOT correct the text by typing directly on the PDF page.**
5. Go through your entire article using the NOTES tool as described in Step 4.
6. When you have completed the corrections to your article, go to File/Export/Annotations (in Acrobat 4.0) or File/Export/Notes (in Acrobat 3.0). Save your NOTES file to a place on your harddrive where you can easily locate it. **Name your NOTES file with the article number assigned to your article in the original softproofing e-mail message.**
7. **When closing your article PDF be sure NOT to save changes to original file.**
8. To make changes to a NOTES file you have exported, simply re-open the original PDF proof file, go to File/Import/Notes and import the NOTES file you saved. Make changes and re-export NOTES file keeping the same file name.
9. When complete, attach your NOTES file to a reply e-mail message. Be sure to include your name, the date, and the title of the journal your article will be printed in.

111 RIVER STREET, HOBOKEN, NJ 07030, USA

*****IMMEDIATE RESPONSE REQUIRED*****

Please follow these instructions to avoid delay of publication.

READ PROOFS CAREFULLY

- This will be your only chance to review these proofs.
- Please note that the volume and page numbers shown on the proofs are for position only.

ANSWER ALL QUERIES ON PROOFS (Queries for you to answer are attached as the last page of your proof.)

- Mark all corrections directly on the proofs. Note that excessive author alterations may ultimately result in delay of publication and extra costs may be charged to you.

CHECK FIGURES AND TABLES CAREFULLY (Color figures will be sent under separate cover.)

- Check size, numbering, and orientation of figures.
- All images in the PDF are downsampled (reduced to lower resolution and file size) to facilitate Internet delivery. These images will appear at higher resolution and sharpness in the printed article.
- Review figure legends to ensure that they are complete.
- Check all tables. Review layout, title, and footnotes.

COMPLETE REPRINT ORDER FORM

- Fill out the attached reprint order form. It is important to return the form even if you are not ordering reprints. You may, if you wish, pay for the reprints with a credit card. Reprints will be mailed only after your article appears in print. This is the most opportune time to order reprints. If you wait until after your article comes off press, the reprints will be considerably more expensive.

ADDITIONAL COPIES

- If you wish to purchase additional copies of the journal in which your article appears, please contact Jill Gottlieb at (201) 748-8839, fax (201) 748-6021, or E-mail at jgottlieb@wiley.com

Rs 6313 Polymorphism in 5-Hydroxytryptamine Receptor 2A Gene Association With Polysymptomatic Primary Nocturnal Enuresis

Chang-Ching Wei,¹ Lei Wan,^{2–4} Wen-Yuan Lin,⁵ and Fuu-Jen Tsai^{1,2*}

¹Department of Pediatric, China Medical University Hospital, Taichung, Taiwan

²Genetic Center, China Medical University Hospital, Taichung, Taiwan

³School of Chinese Medicine, China Medical University, Taichung, Taiwan

⁴Department of Biotechnology, Asia University, Taichung, Taiwan

⁵Department of Family Medicine, China Medical University Hospital, Taichung, Taiwan

Background: Tricyclic antidepressants (TCA) were used to treat nocturnal enuresis (NE) for decades of years although their real mechanisms are unknown. Recently, some case studies demonstrated the efficacy of selective serotonin reuptake inhibitors (SSRI) in the treatment of NE. Both TCA and SSRI have similar influences on serotonin transmission. This study was aimed at evaluating whether 5-hydroxytryptamine receptor 2A (5HTR2A) gene is associated with NE. **Methods:** We analyzed rs6313 polymorphism in 5HTR2A gene of 213 Taiwanese children (116 NE cases and 97 healthy control subjects) using polymerase chain reaction-restriction fragment length polymorphism. **Results:** There were no significant differences when comparing the genotypes and allelic frequencies of rs6313 polymorphism in 5HTR2A gene between

patients with NE and control subjects. However, when subsequently comparing 5HTR2A genotypes and allelic frequencies in NE child with different phenotypes, genotypes TT and TC appeared higher risks of polysymptomatic NE compared with CC (odds ratio (OR) = 10.71, 95% confidence interval (CI) = 2.66–43.12; OR = 2.68, 95% CI = 0.67–10.75, respectively; $P = 0.0002$); and allele T also revealed higher frequencies of polysymptomatic NE compared with allele C (OR = 3.7, 95% CI = 2.01–6.79, $P = 0.000015$). **Conclusions:** This is the first study that shows the association between 5HTR2A gene polymorphisms and polysymptomatic NE. These results provide further evidence suggesting that genetic variations at 5HTR2A may influence NE treatment response. *J. Clin. Lab. Anal.* 24:1–5, 2010. © 2010 Wiley-Liss, Inc.

Key words: nocturnal enuresis; serotonin

UNCORRECTED PROOF

INTRODUCTION

Primary nocturnal enuresis is a common disorder with an estimated prevalence of 5–10% at the age of 7 years and a spontaneous cure rate 15% per year (1–5). However, 1–2% of enuresis children continue to be wet in adulthood. Nocturnal enuresis (NE) comprises a heterogeneous group of disorders and clinicians usually divide NE into two forms: mono- and polysymptomatic NE. Polysymptomatic NE is bed-wetting associated with severe urgency, severe frequency, or other signs of an unstable bladder. Monosymptomatic NE is bed-wetting associated with normal daytime urination.

Children who have polysymptomatic NE are far more difficult to treat. The exact etiology of NE has not been fully elucidated. In about 75% of affected children, there is a strong family history of enuresis (6). It is generally accepted that genetic factors play an

Published online in Wiley InterScience (www.interscience.wiley.com).

**2 Wei et al.**

1 important role in NE. The molecular genetic approach
 of enuresis have been performed since 1995 and several
 3 highly positive markers has been found on chromoso-
 ne12q, 13q13–q14.3 (ENUR1), and 22q11 (ENUR3) by
 5 linkage analyses (7–11). These research findings also
 demonstrate genetic heterogeneity of NE. Multigenera-
 7 tional linkage analyses seem to be difficult to perform in
 our country because most families are small households.
 9 On the basis of our previous experiences, we used single
 nucleotide polymorphisms (SNP) as a tool and found
 11 several genetic markers for some complex diseases of
 polygenic traits. Therefore, we attempted to use SNP to
 13 search the genetic markers of NE and to assess the
 influence of these polymorphisms in the susceptibility of
 15 NE. Tricyclic antidepressants (TCA) were used to treat
 NE for decades of years although their real mechanisms
 17 are unknown. Recently, some case studies demonstrated
 the efficacy of selective serotonin reuptake inhibitors
 19 (SSRI) in the treatment of NE. Both TCA and SSRI
 have similar influences on serotonin transmission.
 21 Linkage studies indicate that 13q contains a locus or
 loci for NE, and 5-hydroxytryptamine receptor 2A
 23 (5HTR2A) gene was mapped on chromosome
 13q14. This study was aimed at evaluating whether
 25 5HTR2A gene polymorphisms are associated with NE.
 As all children enrolled in this study were assessed in
 27 great detail, possible specific associations with pheno-
 types of NE were also analyzed.
 29

MATERIALS AND METHODS**Study Population**

31 This study included 213 Taiwanese children. One
 33 hundred sixteen (61 boys and 55 girls) were patients of
 35 NE and 97 (50 boys and 47 girls) were healthy control
 37 subjects. This study was approved by the Ethics
 Committee of China Medical University Hospital,
 39 Taichung, Taiwan. All children included in this experi-
 ment had been above 7 years of age and they were
 41 studied after their parents had signed informed consent.
 These children received a thorough physical and
 43 neurologic examination, urinalysis, and ultrasonogra-
 phy. Children with secondary NE, neurogenic voiding
 45 dysfunction, known structural urinary tract obstruction
 or complex urinary tract malformations, urinary tract
 47 infection or abnormal renal function were excluded
 from this experiment. The phenotypes of NE were
 49 subtyped according to arousal scores, the presences of
 daytime voiding symptoms (DVS) and constipation. The
 51 arousal scores were measured using “scoring system for
 assessing arousal from sleep” referred to a previous
 53 study (12). DVS was defined as more than one of the
 following voiding problems (urinary urgency, hesitancy,

and small bladder functional capacity). Constipation
 was defined as less than 3 bowel movements per week.

Genotyping

59 Genomic DNA was extracted and purified from
 61 peripheral whole blood leukocytes using a DNA
 extractor kit (Genomaker DNA extraction kit; Blossom,
 Taipei, Taiwan). A total of 50 ng of genomic DNA was
 63 mixed with 20 pmol of each polymerase chain reaction
 (PCR) primer in a total volume of 25 μ l containing
 65 10 mM Tris-hydrochloride, pH 8.3; 50 mM potassium
 chloride; 2.0 mM magnesium chloride; 0.2 mM each
 67 deoxyribonucleotide triphosphate; and 1 U of DNA
 polymerase (Amplitaq; Perkin-Elmer, Foster City, CA).
 The rs6313 polymorphism in 5HTR2A gene was
 69 detected using the oligonucleotide primers 5'-CCAAA-
 TACCTCGATAGTGCTG-3' and 5'-CGGCTGTCAG-
 71 TAAAGCAGAC-3' to amplify a 432-bp segment
 covering the polymorphic site. The PCR conditions
 were as follows: 35 cycles at 95°C for 30 s, 60°C for 30 s,
 73 and 72°C for 45 s, then standing at 72°C for 7 min and
 holding at 4°C. The polymorphism was analyzed by
 75 using PCR amplification followed by restriction analysis
 (restriction enzyme: BspEI). The products were analyzed
 77 directly on agarose gel by electrophoresis and each allele
 was recognized according to its size. Allele frequencies
 79 were expressed as a percentage of the total number of
 alleles. Genotypes and allelic frequencies for rs6313
 81 polymorphism in 5HTR2A gene between different
 phenotypes were compared.
 83

Statistical Analysis

85 Given that the type I error is 0.05, group sample size
 87 34 in group one and 62 in group two achieve 85%
 89 power, whereas group sample size 50 in group one and
 91 50 in group two achieve 90% power to detect a
 difference between the group proportions of 0.3. The
 93 observed genotype frequencies were tested for Hard-
 y–Weinberg equilibrium by χ^2 analysis. The Woolf logit
 95 method was used to determine the odds ratios (OR) and
 95% confidence intervals (CI). The software used for the
 97 analyses included SPSS for Windows (SPSS Inc.,
 Chicago, IL). A value of $P < 0.05$ was defined as
 99 statistically significant.

RESULTS**Clinical Presentations of Patients with NE and Controls (Table 1)**

101 There were no significant demographic differen-
 103 ces between enuresis patients and normal control
 105 subjects regarding age, gender, body weight, and height
 107 (Table 1).

Genotype and Allelic Frequencies of rs6313 Polymorphism in 5HTR2A Gene in Patients with NE and Controls (Table 2)

When we compared the allelic frequencies and genotypes of rs6313 polymorphism in 5HTR2A gene of NE with those of control subjects, no significant differences were found (Table 2).

Genotypes and Allelic Frequencies of rs6313 Polymorphism in 5HTR2A Gene in NE Children Presented With Different Phenotypes (Table 3)

Table 3 summarized genotypes and allele frequencies of rs6313 polymorphism in 5HTR2A gene between NE children presented with different phenotypes, including arousal scores, DVS, and constipation. The arousal scores were not significantly different among the three genotypes and allelic frequencies. However, we found a significant difference in genotype distribution and allelic frequency of polysymptomatic NE. TT and TC appeared higher risks of NE with DVS compared with CC (OR = 10.71, 95% CI = 2.66–43.12; OR = 2.68, 95% CI = 0.67–10.75, respectively; $P = 0.0002$). TT and TC also appeared to have higher risks of NE with constipation compared with CC (OR = 12.71, 95% CI = 2.59–62.33; OR = 1.83, 95% CI = 0.35–9.6, respectively; $P = 0.00001$). Allele T showed higher frequencies of polysymptomatic NE compared with allele C

| $P = 0.00001$ | | | | | | | |
| $P = 0.000002$ | | | | | | | |

The Pearson χ^2 test was performed to obtain the P value. A P value of <0.05 was considered as statistically significant. Patient numbers may not add up to 116 because of some clinical data are missing.

4 Wei et al.

1 (OR = 3.7, 95% CI = 2.01–6.79, $P = 0.000015$). Allele T
 2 also showed higher frequencies of NE with constipation
 3 compared with allele C (OR = 5.02, 95% CI = 2.48–
 4 10.14, $P = 0.00002$).

7 DISCUSSION

8 Imipramine, a tricyclic antidepressant, was introduced
 9 to treat NE in 1960 and since then several studies
 10 revealed Imipramine had effects on a reduction in wet
 11 nights (13,14). Although TCA had been primarily used
 12 to treat the affective disorders, clinical investigations in
 13 the last decade suggested that non-affective disorders,
 14 such as enuresis, also have therapeutic effects (15). It
 15 was also suggested that associations between a variety of
 16 psychiatric disorders and incontinence, such as depres-
 17 sion and attention deficit hyperactivity disorder (16,17).
 18 The “shotgun” hypothesis explains the multiple ther-
 19 apeutic effects of TCA based on multiple actions of
 20 TCA (e.g., on adrenergic receptors vs. muscarinic
 21 receptors vs. serotonin receptors) (15). TCA would
 22 increase neurotransmitters in the synaptic cleft and
 23 promote serotonin or noradrenaline transmission (18).
 24 Animal studies also showed that TCA exerted an
 25 inhibitory action on the maturation reflex by a central
 26 cholinergic mechanism resulting in detrusor muscle
 27 relaxation. Another studies showed imipramine had
 28 acute modulatory effect on increasing threshold of the
 29 spinal reflex via inhibition of serotonin reuptake in nerve
 30 terminals (19). On the other hand, lowering mono-
 31 amines, such as serotonin and noradrenaline, in the
 32 central nervous system leads to depression, urinary
 33 frequency, and a hyperactive bladder in experimental
 34 animals (16). Recently, some case studies presented the
 35 efficacy of SSRI, such as sertraline and fluoxetine, in the
 36 treatment of enuresis (20–22). These findings also have
 37 the same implications that serotonin might play an
 38 important role in NE.

39 Serotonin is an important neurotransmitter, which
 40 participates in many physiologic processes such as sleep,
 41 appetite, thermoregulation, pain perception, and hor-
 42 mone secretion. Lack of arousal responses to distension-
 43 induced maturation reflex has been accepted as the main
 44 dysfunctions of NE and both of them are mediated by
 45 nuclei in the brainstem (23–25). The 5HTR2A gene
 46 mapped on chromosome 13q14, which contains three
 47 exons and two introns, encodes the 5-hydroxytrypta-
 48 mine receptor 2A, which is a postsynaptic G protein-
 49 linked receptor. Genetic variation in 5HTR2A gene may
 50 contribute to these discrepancies in 5HTR2A receptor
 51 expression and subsequently influence serotonin trans-
 52 mission.

53 This study is the first one to search the associations
 between 5HTR2A gene polymorphisms and NE. It was

determined that rs6313 polymorphism in 5-hydroxy-
 tryptamine receptor 2A gene may not be associated with
 NE in Taiwanese children. These associations were
 statistically significant only when analyses were per-
 formed in polysymptomatic NE and NE with constipa-
 tion. These results further support the previous
 observations that NE is heterogeneous disorder. The
 heterogeneity of NE has been manifested in the
 distinction between mono- and polysymptomatic forms,
 based on the absence or presence of bladder over-
 activity. The causes of monosymptomatic NE and
 polysymptomatic NE might be different and serotonin
 might have influence on polysymptomatic NE. Further
 studies with larger samples together may help to
 determine the exact role of 5HTR2A gene in enuresis.
 Children with the polysymptomatic form had a number
 of associated bladder and bowel problems. Clinically, it
 is important to distinguish the two types of NE to find
 the most appropriate treatment. This may open a new
 door in NE molecular genetics research and elucidate
 the complex interplay among the neurotransmitter
 systems in the etiology of NE.
