Novel Vilsmeier-type Methylenation for Synthesis of

Dipyrazolylmethane Derivatives using Formamide or

N-methylformamide

Key words: Vilsmeier-type reaction, methylenation, dipyrazolylmethane, pyrazolone, formylation

Abstract

A novel Vilsmeier-type methylenation for synthesis of dipyrazolylmethanes was developed by reacting pyrazolones with formamide or *N*-methylformamide in the presence of phosphorous oxychloride POCl₃ coupling agent. This newly developed method can be efficiently provided a series of dipyrazolylmethane derivatives as the main products in excellent yields without the formylated products. Our experimental result was different with the classical Vilsmeier-type reaction.

Introduction

In 1927, the Vilsmeier or Vilsmeier–Haack reaction was first published and applied to an immense variety of substrates, from substituted benzenes to complex heterocycles. ^{1,2} The classical Vilsmeier reagent, involves electrophilic substitution of an activated aromatic ring with a halomethyleniminium salt, which results from the reaction between an acid chloride (e.g., POCl₃, SOCl₂, (COCl)₂, and COCl₂) and an amide, usually DMF (see Scheme 1). When DMF was used in the reaction, the product of Vilsmeier reaction is an aldehyde. Thus, Vilsmeier reaction is often called as Vilsmeier formylation.³

Scheme 1

Vilsmeier reagent serves not only as a formylating agent,³ but also as an activating reagent for carboxylic acids to give esters,⁴ amides⁵ and acid chlorides,⁶ and for alcohols to give alkyl chlorides,⁷ esters,⁸ alkyl aryl sulfides⁹ and imides.¹⁰ Since, it is now used as a powerful organic synthetic tool for the formylation¹⁻³ or construction^{11,12} of many aromatic and heterocyclic compounds. Herein, we are a lot of interests in the study of reactive ability of various amides.¹³ Thus, we attempted to investigate the reactivity pyrazolones with various amides including formamide, *N*-methylformamide, *N*,*N*-dimethylformamide (DMF), and *N*,*N*-diethylformamide (DEF). Eventually, we have successfully provided the new Vilsmeier type methylenation to prepare dipyrazolylmethane derivatives by using formamide or *N*-methylformamide as reaction solvent, which are important key functional¹⁴ or bioactive materials.¹⁵

Result and Discussion

5-Pyrazolone derivatives were prepared as the starting materials by following the previous literature reported procedure via tandem condensation and thermal cyclization. 16 In this newly developed method, we chose 1,3-diphenyl-1*H*-pyrazol-5-one (2) as the model for the selection of best conditions for the new Vilsmeier-type methylenation reaction (see Scheme 1). To search for optimum conditions and establish a reproducible procedure, compound 2 was allowed to react with formamide (3.0 equivalent) and phosphorous oxychloride (POCl₃, 5.0 equivalent) in CH₂Cl₂ solution at reflux (~ 50–60 °C) within 0.5–1 h. After aqueous worked-up and purification by column chromatography on silica gel, we isolated the corresponding methylenated product 3 in 96% yield without the formylated product 4 (see Scheme 2).

Scheme 2

To examine the solvent effects, we applied the same condition to 1,3-diphenyl-1*H*-pyrazol-5-one **2a** and various of amides containing *N*-methylformamide *N*,*N*-dimethylformamide (DMF), and *N*,*N*-diethylformamide (DEF) in the presence of POCl₃. Based on the experimental result, up to 86% yields of the formylated product **4** have been achieved when the pyrazolone **2a** was reacted with DMF and DEF (see Entry 3–4 of Table 1). When pyrazolone **2a** was used toward *N*-methylformamide within 0.5–1.0 h, we also found the methylenated product **3a** was obtained in 71% yield without the formylated product. Otherwise, the starting material **2a** was recovery in same condition (see entry 2 in Table 1).

3	Me	Me	-	_b	4	86	
4	Et	Et	-	_b	4	89	

^aThe formulated product was not detectable.

Furthermore, we propose the plausible mechanism shown in Scheme 1 and Scheme 3, and accounts for the different between the classical Vilsmeier formylation and the newly developed Vilsmeier methylenation. Firstly, amide agents was fast with oxychloride POC₁₃ form the reacted phosphorous reactive halomethyleniminium salts 1 in situ and side product HCl (see Scheme 1).¹⁷ In the presence of acidic species including excess amount of POCl₃ and HCl, pyrazolones 5 was performed isomerization to convert to pyrazoles 6. Further, pyrazoles 6 was reacted with the reactive iminium species 1 to generate the imidination intermediate 8 and 9 through the reactive species 7 (see Scheme 3). For N,N-dimethylformamide (DMF) and N,N-diethylformamide (DEF) as the reactants, the Vilsmeier formylation was very smooth to generate the corresponding formylated product 10.

^bThe methylenated product was not detectable.

$$R^{2}-N$$

$$R^{1}-N$$

$$R^{2}-N$$

$$R^{2$$

Scheme 3

When formamide and *N*-methylformamide, were used in this procedure, the imidination intermediate **9** was effectively transferred to the more stable aminomethylidene derivatives **11** according to the formation of the intramolecule hydrogen-bonding. Consequently, the Michel addition of intermediate **11** with another equivalent of pyrazole **6** leads to dipyrazolyl-aminomethane **11**. After the protonation and hydrolysis two reactions were completed, the final product **13** was usefully obtained in excellent yield (see Scheme 3).

For the further investigation of the reliable procedure of the new developed Vilsmeier type methylenation, we also extended the pyrazolone scopes to 3-phenyl-pyrazolones **2b–2i** bearing N1-substituted aryl group with various mono-substituents, including o-, m-, p-ClPh, o-, m-, p-MePh, p-BrPh and p-OMePh with formamide. When employing the condition was shown in Scheme 4, all of substrates can be successfully converted to the corresponding methylention dipyrazolylmethane products **3b–3i** in $\geq 84\%$ yields (see Table 2). More specifically,

1-(2,4-dinitrophenyl)-3-phenyl-1*H*-pyrazol-5-one (**2j**) own two strong withdrawing NO₂ groups in *N*1-aromatic ring, the corresponding dipyrazolylmethanes **3j** did not detected in the same condition. 1-(2,4,6-Trichlorophenyl)-3-phenyl-1*H*-pyrazol-5-one (**2k**) having three chloro-substituents was also reacted with HCONH₂ and produced the corresponding dipyrazolylmethanes **3k** in 87% yield (see Table 2). The dipyrazolylmethanes **3a–3k** were reported and fully characterized by spectroscopic methods. ^{14a,b,d} For example, compound **2a** presented a peak at δ 8.51 ppm for –C¹H=C in ¹H NMR. In ¹³C NMR spectrum, compound **2a** possessed characterization absorptions at δ 109.5 ppm for methylene carbon – ¹³CH=C. The IR absorptions of **2a** showed peaks at 2109 cm⁻¹ for stretching of the –CH=C group and at 3291 cm⁻¹ for stretching of the –OH group.

2m	Ph	CF ₃	3m	90
2n	Ph	<i>n</i> -Pr	3n	92
20	Ph	<i>i</i> -Pr	30	91

For the further investigation of the substituent effects, we extended this newly developed method toward 1-phenyl-3-substituted pyrazolones 2l-2o, which contained Me, CF₃, n-Pr, or i-Pr groups at the C-3 position on pyrazolic ring. The corresponding dipyrazolylmethane products 3l-3o were obtained in 90–93% yields (see Table 2). Therefore, this efficient Vilsmeier-type methylenation method can also be successfully applied to synthesize a series of dipyrazolylmethane derivatives 3a-3o.

To search for the optimum condition for N-methylformamide as reaction solvent, we used 1,3-diphenyl-1H-pyrazol-5-one 2a as mold and tried to prolonged the reaction time from 1.0 h to 2.0 h. Fortunately, the isolated yield of desired product 3a was promoted from 71% to 95% (see Scheme 4 and Table 3). As a result, the optimum condition was extended 1,3-disubstituted-1*H*-pyrazol-5-ones **2b–2c**, **2h**, **2l**, and 20 with N-methylformamide. The desired dipyrazolylmethane products 3b-3c, 3h, **31**, and **30** were also obtained in good to excellent yields (82–94%, see Table 3). However, formylated compounds detectable the were also not using *N*-methylformamide as the reaction solvent.

Table 3. The results of the pyrazolones reacted with N-methylformamide in the

presence of POCl₃

Pyrazolones (2a–2c, 2h, 2l, and 2o)			Reaction Time	Dipyrazoylmethanes

In conclusion, we have successfully developed the newly Vilsmeier-type methylenation method by treating various 1,3-disubstituted pyrazolones with formamide or *N*-methylformamide and POCl₃ coupling agent. Based on our experimental data, the result was different with the classical Vilsmeier-type reaction. And the yielding dipyrazolylmethane products without formylated compounds seemed determinate to the solvents involved formamide and *N*-methylformamide.

Experimental Section

General Procedure: All chemicals were reagent grade and used as purchased. All reactions were carried out under nitrogen atmosphere and monitored by TLC analysis. Flash column chromatography was carried out on silica gel (230–400 mesh). Commercially available reagents were used without further purification unless

otherwise noted. Dichloromethane, ethyl acetate, hexanes, and methanol were purchased from Mallinckrodt Chemical Co. The following compounds were purchased from Acoros Chemical Co: ethyl Butyrylacetate, ethyl acetoacetate, 2,4-dinitrophenyl hydrazine, formamide, phenylhydrazine, o-tolylhydrazine hydrochloride, m-tolylhydrazine hydrochloride, p-tolylhydrazine hydrochloride. 2,4,6-Trichlorophenyl hydrazine were purchased from TCI Chemical Co. 4-Bromophenylhydrazine hydrochloride, 2-chlorophenylhydrazine hydrochloride, 3-chlorophenylhydrazine hydrochloride, 4-chlorophenylhydrazine hydrochloride, ethyl benzoylacetate, isobutyrylacetate, ethyl ethyl trifluoroacetoacetate, 4-methoxyphenylhydrazine hydrochloride were purchased from Alfa Chemical Co. Phosphorylchloride were purchased from FERAK Chemical Co. Purification by gravity column chromatography was carried out by use of Merck Reagents Silica Gel 60 (particle size 0.063–0.200 mm, 70–230 mesh ASTM). Infrared (IR) spectra were measured on a Bomem Michelson Series FT-IR spectrometer. The wavenumbers reported are referenced to the polystyrene 1601 cm⁻¹ absorption. Absorption intensities are recorded by the following abbreviations: s, strong; m, medium; w, weak. Proton NMR spectra were obtained on a Bruker (200 or 400 MHz) spectrometer by use of CDCl₃ as solvent. Carbon-13 NMR spectra were obtained on a Bruker (50 or 100 MHz) spectrometer by used of CDCl₃ as solvent. Carbon-13 chemical shifts are referenced to the center of the CDCl₃ triplet (δ 77.0 ppm). Multiplicities are recorded by the following abbreviations: s, singlet; d, doublet; t, triplet; q, quartet; m, multiplet; J, coupling constant (Hz). Elemental analyses were carried out on a Heraeus CHN–O RAPID element analyzer.

Standard Procedure for the Synthesis of Dipyrazolylmethane Derivatives (3a-3i and 3k-3o)

The reliable procedure involved the treatment of pyrazolones (**3a-3i** and **3k-3o**, 1.0 equivalent) with catalytic amount of POCl₃ (~3 equivalent) in formamide solution (2 mL) at 50–60 °C within 0.5–1 h. When the reaction was completed, the reaction mixture was concentrated, added to saturate sodium bicarbonate (15 mL) and extracted with dichloromethane (15 mL). The organic extracts were dried over MgSO₄, filtered, and concentrated under reduced pressure. The residue solution was purified by column chromatography on silica gel to give the corresponding dipyrazolylmethane products (**3a-3i** and **3k-3o**) in 82–96% yields.

Calcd for C₃₃H₂₆N₄O₄: C: 73.05; H: 4.83; N: 10.33. Found: C: 73.07; H: 4.85; N: 10.31.
- **4,4'-Methylidenebis**[**1-(2'-4'-6'-trichorophenyl)-3-phenyl-2-pyrazolone**] (**3k**): mp (recrystallized from ethanol) 144–146 °C; ¹H NMR (CD₃OD, 200 MHz) δ 7.34–7.43 (m, 3H, ArH), 7.68–7.72 (m, 4H, ArH); ¹³C NMR (50 MHz, CD₃OD) δ 47.1, 125.4 (2

- \times CH), 128.4 (2 \times CH), 128.6 (2 \times CH), 129.1 (2 \times CH), 130.6, 132.1, 136.4, 152.8, 156.9, 171.0; IR (KBr) 3075 (m), 1732 (s, C=O), 1559 (s, C-N), 1461 (s), 1380 (m), 1157 (m), 1097 (m), 983 (m), 829 (m) cm⁻¹; Anal. Calcd for C₃₁H₁₆Cl₆N₄O₂: C: 54.02; H: 2.34; N: 8.13. Found: C: 54.03; H, 2.36; N, 8.11.
- **4,4'-Methylidenebis**(**3-methyl-1-phenyl-2-pyrazolone**) (**3l**): mp (recrystallized from ethanol) 127–129 °C; ¹H NMR (CDCl₃, 200 MHz) δ 2.15 (s, 3H, CH₃), 7.14 (d, 1H, J = 2.2 Hz, ArH), 7.36 (dd, 2H, J=7.8, 2.2 Hz, ArH), 7.81 (d, 2H, J=7.8 Hz, ArH); ¹³CNMR (50 MHz, CDCl₃) δ 17.0, 43.1,118.9 (2 × CH),125.1,128.8 (2 × CH),137.9, 156.4,170.6; IR (KBr) 3101 (s), 2802 (m),1622 (s, C=O),1584 (s, C–N), 1494 (m), 1412 (m), 1301 (s), 1220 (m), 1035 (m), 967 (m) cm⁻¹; Anal. Calcd for C₂₁H₁₈N₄O2: C: 70.38; H: 5.06; N: 8.93. Found: C: 70.41; H: 5.09; N: 8.96.
- **4,4'-Methylidenebis**(**1-phenyl-3-trifluoromethyl-2-pyrazolone**) (**3m**): mp (recrystallized from ethanol) 194–196 °C; ¹HNMR(CDCl₃, 200 MHz) δ 6.61 (s, 1H, ArH), 7.66 (d, 2H, J=7.8 Hz, ArH), 7.80 (d, 2H, J=7.6 Hz, ArH); ¹³C NMR (50 MHz, DMSO-d6) δ 85.6, 122.3, 127.2, 129.1, 137.7, 140.4 (q, 3JC–F=37.6 Hz), 153.7. Anal. Calcd for C₂₁H₁₂F₆N₄O₂: C: 54.09; H: 2.59; N: 12.01. Found: C: 54.12; H: 2.57; N: 12.59.
- **4,4'-Methylidenebis**(3-*n*-propyl-1-phenyl-2-pyrazolone) (3n): mp (recrystallized from ethanol) 201–202 °C; ¹H NMR (CDCl₃, 200 MHz) δ 1.28 (d, J=7 Hz, 6H), 2.79 (m, 1H), 7.21 (t, J = 7.4 Hz, 1H), 7.41 (dd, J = 7.4, 8 Hz, 2H), 7.92 (d, J = 8 Hz, 2H); ¹³C NMR (50 MHz, CDCl₃) δ 20.5, 31.2, 40.3, 119.3, 125.4, 129.2, 138.7, 164.7, 171.1; IR (KBr) 3101 (s), 2802 (m), 1622 (s, C=O), 1584 (s, C-N), 1494 (m), 1412 (m), 1301 (s), 1220 (m), 1035 (m), 967 (m) cm⁻¹. Anal. Calcd for C₂₅H₂₆N₄O₂: C: 72.44; H: 6.32; N: 13.52. Found: C: 72.47; H: 6.36; N: 13.49.
- **4,4'-Methylidenebis**(**3-isopropyl-1-phenyl-2-pyrazolone**) (**3o**): mp (recrystallized from ethanol) 101–103 °C; 1 H NMR (CDCl₃, 200 MHz) δ 1.21 (d, 6H, J=7.4,

CH(CH₃)₂), 2.68–2.82 (m, 1H, CHMe2), 7.14 (t, 1H, J=7.4, ArH), 7.35 (dd, 2H, J = 8.1, 7.4 Hz, ArH), 7.84 (d, 2H, J = 8.1 Hz, ArH); 13 C NMR (50 MHz, CDCl3) δ 20.1 (2 × CH3), 30.7, 39.8, 118.8 (2 × CH), 124.9, 128.8 (2 × CH), 138.2, 164.3, 170.6; IR (KBr) 3101 (s), 2802 (m), 1622 (s, C=O), 1584 (s, C–N), 1494 (m), 1412 (m), 1301 (s), 1220 (m), 1035 (m), 967 (m) cm⁻¹. Anal. Calcd for C₂₅H₂₆N₄O₂: C: 72.44; H: 6.32; N: 13.52. Found: C: 72.41; H: 6.35; N: 13.53.
